CLEAN COPY OF THE CLAIMS

Shown below are a clean copy of the claims:

- 1. (Canceled)
- 2. (Canceled)
- 3. (Canceled)
- 4. (Canceled)
- 5. (Canceled)
- 6. (Canceled)
- 7. (Currently Amended) A software program for facilitating the use of a distributed directory running in a computer network, the program comprising being stored on a recordable medium and including instructions for:

receiving an event from the distributed directory into an XML generator; converting the event into XML data representing the event;

transforming the XML data representing the event to a first predetermined formed by a transformation processor using a first stylesheet, the first predetermined format being responsive to a first application running in the computer network;

transmitting the transformed XML data representing the event to the first application; transforming the XML data representing the event to a second predetermined format by the transformation processor using a second stylesheet, the second predetermined format being responsive to a second application running in the computer network; and

transmitting the transformed XML data representing the second event to the second application.

- 8. (Canceled)
- 9. (Previously Presented) The software program of claim 7 further comprising instructions for:

receiving updates to the first stylesheet responsive to any changes in either the distributed directory or the first application.

- 10. (Canceled)
- 11. (Currently Amended) The software program of claim 7 further comprising instructions for:

detecting the event through notification from an event handler of the distributed directory.

- 12. (Canceled)
- (Canceled) 13.
- 14. (Canceled)
- (Currently Amended) A software program for facilitating the use of a 15. distributed directory running in a computer network, the program comprising instructions for: receiving a first event from a first application in a first native application format; converting the first event into markup language data;

transforming the first event to a predetermined format by a transformation processor using a transformation profile, the predetermined format being responsive to the distributed directory, the transformation profile including formatting instructions for transforming the markup language data to the predetermined format;

transmitting the transformed first event to the distributed directory;

receiving a second event from a second application in a second native application format;

converting the second event into markup language data;

transforming the second event to the predetermined format by the transformation processor using the transformation profile;

Page 18 of 23

transmitting the transformed second event to the distributed directory.

16. (Canceled)

17. (Canceled)

- 18. (Currently Amended) A distributed computer system comprising:
- a first processor connected to a network for executing computer code;
- a second processor connected to the network for executing computer code;
- a first memory connected to the first processor;
- a second memory connected to the second processor;
- a distributed directory, wherein first and second portions of the distributed directory are stored in the first memory and the second memory, respectively;
- a first application, a portion of which being stored in one of the first memory and the second memory;
- a second application, a portion of which being stored in one of the first memory and the second memory;
- a first transformation profile defining a first predetermined format for use by the first application;
- a second transformation profile defining a second predetermined format for use by the second application;

software for detecting a directory event in the distributed directory;

software for transforming the directory event to the first predetermined format by using a generic transformation tool and the first transformation profile;

software for transforming the directory event to the second predetermined format by using the generic transformation tool and the second transformation profile;

software for providing to the first application the directory event transformed to the first predetermined format; and

software for providing to the second application the directory event transformed to the second predetermined format.

- 19. (Previously Presented) The system of claim 18 further comprising: software for converting the directory event to a generic data description before transforming the directory event.
 - 20. (Currently Amended) The system of claim 18 further comprising:

an application shim for the first application to receive the transformed directory event and provide the directory event to the first application by using a first native application program interface for the first application.

- 21. (Canceled)
- 22. (Currently Amended) The system of claim 18 wherein the generic transformation tool utilizes a markup language and the software for transforming the directory event utilizes a transformation processor.
 - 23. (Canceled)
 - 24. (Canceled)
 - 25. (Canceled)
 - 26. (New) The software program of claim 7 wherein:

transmitting the transformed XML data representing the first event to the first application includes transmitting the transformed XML data representing the event to the first application through a first application shim to provide the transformed XML data representing the second event to the first application by using a first native application program interface for the first application; and

transmitting the transformed XML data representing the second event to the second application includes transmitting the transformed XML data representing the event to the second application through a second application shim to provide the transformed XML data representing the event to the second application by using a second native application program interface for the second application.

- 27. (New) The software program of claim 7 wherein the first predetermined format and the second predetermined format are the same predetermined format.
 - 28. (New) The software program of claim 7 further:

transforming the first event to a second predetermined format by the transformation processor using a second transformation profile, the second predetermined format being

responsive to the second application, the transformation profile including formatting instructions for transforming the markup language data to the second predetermined format; and

transmitting to the second application the first event transformed to the second predetermined format.

29. (New) The system of claim 18 further comprising:

a directory transformation profile defining a directory predetermined format for use by the distributed directory;

software for detecting an application event in the first application;

software for transforming the application event to the directory predetermined format by using the generic transformation tool and the directory transformation profile; and software for providing the transformed application event to the distributed directory.

- 30. (New) The system of claim 29 further comprising: software for detecting a second application event in the second application; software for transforming the second application event to the directory predetermined format by using the generic transformation tool and the directory transformation profile; and software for providing the transformed second application event to the distributed directory.
 - 31. (New) The system of claim 20 further comprising:

a second application shim for the second application to receive the transformed directory event and provide the directory event to the second application by using a second native application program interface for the second application.

32. (New) A method for interfacing with a directory in a computing system, comprising:

providing a first transformation profile defining a first predetermined format for use by a first application;

providing a second transformation profile defining a second predetermined format for use by a second application;

detecting an event in the directory;

transforming the event to the first predetermined format by using a transformation tool and the first transformation profile;

transforming the event to the second predetermined format by using the transformation tool and the second transformation profile;

providing to the first application the event transformed to the first predetermined format; and

providing to the second application the event transformed to the second predetermined format.

- 33. (New) The method of claim 32 further comprising the step of: converting the event to a generic data description before transforming the event to the first predetermined format and the second predetermined format.
- 34. (New) The method of claim 32 further comprising the step of:
 providing an application shim for the first application to receive the event transformed
 to the first predetermined format and to provide the event to the first application by using a
 native application program interface for the first application.
- 35. (New) The method of claim 34 further comprising the step of: updating the application shim and the first transformation profile responsive to changes in the first application.
- 36. (New) The method of claim 34 further comprising the step of:
 providing a second application shim for the first application to receive the event
 transformed to the second predetermined format and to provide the event to the second
 application by using a second native application program interface for the second application.
- 37. (New) The method of claim 36 further comprising the step of: updating the second application shim and the second transformation profile responsive to changes in the second application.
- 38. (New) The method of claim 32 wherein the transformation profile includes a stylesheet.

- 39. (New) The method of claim 32 wherein the transformation profile is stored in the directory.
- 40. (New) A driver infrastructure for interfacing a directory and applications comprising:
- a generator to receive a directory event from the directory and to generate a generic data for the directory event;
- a first transformation profile defining a first predetermined format for use by a first application;
- a second transformation profile defining a second predetermined format for use by a second application;
- a transformation processor to transform the generic data for the directory event into a first application data for the first application using the first transformation profile and to transform the generic data for the directory event into a second application data for the second application using the second transformation profile; and
- a transmitter to transmit the first application data to the first application and to transmit the second application data to the second application.
 - 41. (New) A driver infrastructure according to claim 40 wherein:

the driver infrastructure further comprises a second generator to receive an application event from the first application and to generate a second generic data for the application event;

the transformation processor is operative to transform the second generic data for the application event into a directory data; and

the driver infrastructure further comprises a receiver to receive the directory data in the directory.
